

Codebook to Ambuehl and Li

“Belief Updating and the Demand for Information”

This document explains the variable names generated by `dataManagement.do`. Demographic variables are explained in the file `codebookQuestionnaire.rtf`.

Stata variable name	Variable
<code>a</code>	$P_I(\sigma = 1 s = 1)$
<code>b</code>	$P_I(\sigma = 0 s = 0)$
<code>asymmetry</code>	a_I
<code>boundary</code>	b_I
<code>b_p1</code>	$P_I(\sigma = 1)$
<code>b_p0</code>	$P_I(\sigma = 0)$
<code>p11</code>	$P_{I,i}(s = 1 \sigma = 1)$
<code>p00</code>	$P_{I,i}(s = 0 \sigma = 0)$
<code>b_p11</code>	$P_I(s = 1 \sigma = 1)$
<code>b_p00</code>	$P_I(s = 0 \sigma = 0)$
<code>b_first</code>	First round in which a Bayesian updater bet on a box in Gradual Information Task
<code>ball1_part1 - ball6_part1</code>	Realization of the x th ball drawn in the practice stage
<code>dev_bayes_v</code>	$\Delta v_{I,i}$
<code>dev_logit_bayes_p00</code>	$\Delta P_{I,i}(s = 1 \sigma = 1)$
<code>dev_logit_bayes_p11</code>	$\Delta P_{I,i}(s = 0 \sigma = 0)$
<code>diff_logit_b_post_when_hit</code>	$\Delta b_{I,i}$
<code>first</code>	First round in which the subject bet on a box in Gradual Information Task

group	equals 0 if the subject went through the information structures in reverse order in the Information Valuation and Belief Elicitation Tasks and 1 otherwise
group_part4	equals 0 if the subject went through the information structures in reverse order in the Probability Assessment Task and 1 otherwise
info_structure	I . Information structures $I > 10$ pertain to the Gradual Information Task or Robustness Sessions
p1	$P_{I,i}(\sigma = 1)$. If $P_{I,i}(\sigma = 0)$ was elicited, this equals $1 - P_{I,i}(\sigma = 0)$.
p1_elic	$P_{I,i}(\sigma = 1)$. If $P_{I,i}(\sigma = 0)$ was elicited, this equals $P_{I,i}(\sigma = 0)$.
rogue	Equals 1 for outlier subjects, and 0 for all others.
session	Session ID.
subject	i . Subject ID. Subjects in session s have IDs between $100s$ to $100(s + 1)$,
switch	Highest line in a price list for which the evaluation option is preferred
tag_sub	Subject tag. Equals 1 for exactly one observation per subject, and 0 for the remaining observations.
v	$v_{I,i}$
v_pred	$v_{I,i}^{pred} = P_{I,i}(\sigma = 1)P_{I,i}(s = 1 \sigma = 1) + P_{I,i}(\sigma = 0)P_{I,i}(s = 0 \sigma = 0)$
v_pred_true_all	v_I
v_pred_true_cond	$P_{I,i}(\sigma = 1)P_I(s = 1 \sigma = 1) + P_{I,i}(\sigma = 0)P_I(s = 0 \sigma = 0)$
v_pred_true_uncond	$P_I(\sigma = 1)P_{I,i}(s = 1 \sigma = 1) + P_I(\sigma = 0)P_{I,i}(s = 0 \sigma = 0)$
